

THE BEST OF THE PAST BLENDED WITH WHAT TOMORROW WILL DELIVER

Retro Styling, Engineering Excellence and Innovation let the birth of Ariel Rider W-Class

Founders of Ariel Rider, Onal brothers grow up watching WW II movies. While designing the W class they want to add something from muscular lines of World War II bikes with a little pinch of Classic Californian Cruisers which they ride when they were kids.

"We want our riders to feel as cool as Marlon Brando at **The Wild One** and as happy as a kid riding his very first beach cruiser when they sit on an Ariel Rider"

The bike comes with some technological features such as POD which measures the amount of force rider apply on the pedals and using the integrated computer provides extra power from motor when necessary. In this way no hill will steep enough for any riders. The intelligent display lets full control of the bike such as adjusting support level according to your riding style but also let you check certain parameters such as distance, speed, battery status.

Ariel Rider is using Samsung SDI batteris which is also being used by TESLA N series. With such battery combined with Japanese motor technology Ariel Rider provides amazing performance upto 49 km/h speed (where legally allowed) and 80 km range.

The bike combines such high technology and performance with details of style in frame and genuine leather products. They don't come at the expense of its retro character.

Finally we want to quote what our client Steven has told "Finally an ebike i would be proud of riding around"

The bike comes in three different colors and retail price starts from \$1899
