

# Toyota, Kenworth Prove Fuel Cell Electric Truck Capabilities with Successful Completion of Truck Operations for ZANZEFF Project

September 22, 2022

**PLANO, Texas (Sept. 22, 2022)** – Toyota Motor North America and Kenworth Truck Company are proud to announce they have proven the capabilities of their jointly designed heavy-duty, Class 8 fuel cell electric vehicles (FCEVs) as a potential zero-emissions replacement of diesel-powered trucks with the completion of their operations in the Zero- and Near-Zero Emissions Freight Facilities (ZANZEFF) “Shore to Store” project at the Port of Los Angeles, the Los Angeles basin and the Inland Empire.

The primary goal for Toyota and Kenworth’s participation in the project was to nearly match the performance of diesel-powered drayage trucks while eliminating emissions to provide a sustainable solution in heavy-duty transportation. The baseline for the Toyota-Kenworth T680 FCEV truck – codenamed “Ocean” – was a 2017 diesel engine operating about 200 miles a day. The T680 FCEV has a range of about 300+ miles when fully loaded to 82,000 lbs. (GCWR), and with no downtime between shifts for charging and the short 15- to 20-minute fill time, the FCEVs could run multiple shifts a day and cover up to 400 to 500 miles. Kenworth designed and built the Class 8 T680 FCEVs, while Toyota designed and built the powertrain’s fuel cell electric power system powered by hydrogen. The Ocean trucks reduced Greenhouse Gases (GHG) by 74.66 metric tons

of CO2 per truck annually compared to the baseline diesel engine.

The success of the 10 trucks in serving real-world customers was a result of close collaboration among diverse project members, including Kenworth and Toyota, The Port of Los Angeles as the project lead, Shell for hydrogen fuel infrastructure and a grant from the California Air Resource Board (CARB). The program paves the way for further development and commercial opportunities for hydrogen-powered fuel cell electric transportation in California and beyond. Though officially concluding their duties in the ZANZEFF “Shore to Store” project on August 5, 2022, some of the trucks will remain in use as demonstration or working models, including one that will continue supporting Toyota operations in the lower LA Basin.

Although the overall ZANZEFF project is anticipated to conclude later this year, the recently concluded “Shore to Store” project funded under ZANZEFF was proposed with support from Toyota, Kenworth and Shell and funded with a \$41 million grant awarded by CARB. The grant was part of the California Climate Investments, a California initiative that puts billions of cap-and-trade dollars to work reducing greenhouse gas emissions, strengthening the economy and improving public health and the environment. “Shore to Store” provided one of the largest real-world, proof-of-concept test cases to show the practical application of hydrogen-powered fuel cell technology at scale in a framework for freight facilities to structure operations for future goods movement from the “Shore to the Store” in the world.

The 10 “Ocean” trucks for this project were operated by customers, including, among others, Toyota Logistics Services, Total Transportation Services, Inc. and Southern Counties Express. With the completion of this project, the door is now open for the technology to be adopted more widely for use in other heavy-duty applications, including increasing use of heavy-duty trucks in commercial transportation.

The Port of Los Angeles is the busiest container port in North America. The medium-duty and heavy-duty trucks across the state – like those in operation at the Port – only constitute about 3 percent of total vehicles in California, yet they are responsible for roughly 23 percent of the state’s on-road Greenhouse Gas Emissions. The Port of Los Angeles has announced that it hopes to transition drayage fleets to zero-emission powertrains by 2035 and recently announced the [Clean Truck Fund](#) to help support this transition. The port and the surrounding region were an ideal location to demonstrate the fuel cell electric heavy-duty trucks as part of transport operations.

“Collaborating with original equipment manufacturers like Toyota and Kenworth on this demonstration project is an important step toward bringing next-generation technologies to market,” said Port of Los Angeles Executive Director Gene Seroka. “We’re grateful to CARB for its generous grant to support this effort and look forward to additional zero emission vehicles operating at the Port of Los Angeles.”

Shell contributed to the project by building a total of three hydrogen stations (two ZANZEFF and one additional in the operating region), the first public provider in California to fuel heavy-duty trucks. With the set routes for the trucks' drayage operations, the stations were regularly used, providing quick refueling to keep the trucks in operation.

“Shell anticipates a great use-case for hydrogen in Commercial Road Transport here in California and the success of the ZANZEFF project has been an important step in achieving commercialization,” said Wayne Leighty, Shell Hydrogen Mobility, Commercial Head, North America. “Collaborations across both the private and public sectors is key to advancing zero-emissions heavy-duty mobility, and we are grateful to CARB, Port of Los Angeles, and ZANZEFF members for their support.”

Toyota plans to produce [fuel-cell powertrain modules](#) at Toyota Motor Manufacturing Kentucky from 2023.
